# 101 Blockchains | HOW DOES BLOCKCHAIN WORK

## HOW BLOCKCHAIN WORKS

A node initiates a transaction and signs it with its private key.

Next, a block representing the transaction is created on the platform.

The transaction is broadcasted to the peers within the network based on any preset criteria.

The peer nodes then validate the transaction.

The block gets added to the ledger and links itself to the previous block. When a new block arrives after it, the new block cryptographically links back itself to this block.

After validation, it's included in the block. At this point, the transaction is confirmed.

**HOW DOES BLOCKCHAIN CONSENSUS WORK**

Using consensus algorithms nodes within a network can agree whether a transaction is valid or not. There's a lot of consensus algorithms, and each algorithm works differently than one another.

**CAN BLOCKCHAIN WORK WITHOUT CRYPTOCURRENCY?**

CRYPTO

Blockchain can work without cryptocurrency. In fact, a lot of blockchain projects are now moving towards token or crypto less ecosystem such as Hyperledger.

## HOW DOES BLOCKCHAIN AUTHENTICATION WORK

A node requests for authentication, and a verifier node verifies whether the requester is authenticated to join the network or not.

The requester retrieves the RSA public key of the verifier.

Next, the requester encrypts its blockchain address with the RSA public key and sends it to the verifier.

</> RSA — The verifier will use its RSA private key to decrypt the blockchain address.

RSA — Next, the verifier uses the blockchain address to retrieve the requester's RSA public key.

The requester uses its own RSA private key to decrypt the hash and signs it with its private key.

The verifier then sends the encrypted hash to the requester.

Verifier then generates a random string, hash and timestamp and encrypts it with the requester's RSA public key.

Next, the requester encrypts an envelope containing the digital signature, the signed hash, and their blockchain address and sends it to the verifier.

The verifier then decrypts it with its private key and verifies whether the signature is valid or not.

Once the signature verifies the requester is permitted to enter the network.
