

Ultrahigh Resolution Chromatography

Ultrahigh Resolution Chromatography (UHRC) is a powerful analytical technique that enables the separation of complex mixtures with exceptional resolution. It is particularly well-suited for the analysis of biological samples, pharmaceuticals, and environmental pollutants. UHRC achieves high resolution through the use of very long, narrow columns and high flow rates, which result in a large number of theoretical plates and a high plate height. This combination of factors allows for the separation of components that are very similar in their chemical and physical properties. UHRC is a rapidly evolving field, and new developments in column technology and instrumentation are continuing to push the boundaries of what is possible in chromatography.
