Gisches,Vincent Mak,2022-03-09 This book collects and integrates the results of an extensive research program conducted by the authors over the past two decades It spans the disciplines of transportation science operations management and behavioral economics and consists of 16 chapters previously published in peer reviewed academic journals and grouped under three topical sections queueing route choice and departure time The book focuses on strategic interactions in directed networks and laboratory experiments carefully designed to test the descriptive validity of the underlying theoretical models The research question that unifies the chapters is do the conclusions of theoretical literature account for the decisions of network users in controlled laboratory experiments With several major qualifications this book answers this question affirmatively

Evolution of Black Holes in Anti-de Sitter Spacetime and the Firewall Controversy Yen Chin Ong,2015-11-27 This thesis focuses on the recent firewall controversy surrounding evaporating black holes and shows that in the best understood example concerning electrically charged black holes with a flat event horizon in anti de Sitter AdS spacetime the firewall does not arise The firewall which surrounds a sufficiently old black hole threatens to develop into a huge crisis since it could occur even when spacetime curvature is small which contradicts general relativity However the end state for asymptotically flat black holes is ill understood since their curvature becomes unbounded This issue is avoided by working with flat charged black holes in AdS The presence of electrical charge is crucial since black holes inevitably pick up charges throughout their long lifetime These black holes always evolve toward extremal limit and are then destroyed by quantum gravitational effects This happens sooner than the time required to decode Hawking radiation so that the firewall never sets in as conjectured by Harlow and Hayden Motivated by the information loss paradox the author also investigates the possibility that monster configurations might exist with an arbitrarily large interior bounded by a finite
