

CHOOSING A TABLE SAW

For almost two centuries, the table saw has remained a simple machine. There are only four crucial components, the same four that comprised the original invention — a table, a circular saw blade, an arbor, and some means of powering the arbor. However, there have been several useful developments along

the way. For example, most modern table saws also have a fence and a miter gauge to guide the wood past the blade, a blade carriage to adjust the angle and height of the blade in relation to the table, and a blade guard to protect the operator. (See Figure 1-1.)

1-1 The most distinguishing feature of the table saw is, of course, the large table (1). This table is often further enlarged by table extensions (2) on either side. A circular saw blade (3) protrudes through a removable table insert (4) set flush with the table surface. Removing the insert allows access to the arbor (5), the shaft on which the blade is mounted. The arbor is, in turn, mounted in a blade carriage (6), a mechanism that changes the blade height and angle.

To raise or lower the blade, turn the elevation crank (7), usually located toward the front of the saw. To change the blade angle, turn the tilt crank (8), usually located to one side. The blade and arbor are powered by an electric motor (9), located beneath or just behind the table. When cutting across the grain, a miter gauge (10) guides the wood. The gauge travels in one of two miter gauge slots (11) that are ground into the table on either side of the blade. When cut-

ting with the grain, a rip fence (12) guides the wood. This fence is mounted on fence rails (13) in the front and back of the saw. Whether crosscutting or ripping, a saw guard (14) protects you from injury. The guard is often mounted on a splitter (15), which keeps the wood from pinching the blade after it's cut. The components underneath the table saw are enclosed in the saw body (16), and the entire assembly usually rests on a stand (17).
