

DEMOGRAPHIC TRANSITION MODEL

The demographic transition model portrays how a country moves from high birth and death rates to low birth and death rates as it becomes increasingly industrialized.

STAGE 1

High Fluctuating

The first stage consists of high birth and death rates. At this stage, the population is stable or grows quite slowly because the number of births and deaths are almost equal.

STAGE 2

Early Expanding

In the second stage, there is a sharp decline in death rates, causing the population to grow rapidly.

STAGE 3

Late Expanding

The third stage sees the birth rate fall, which slows down population growth.

STAGE 4

Low Fluctuating

In the fourth stage, both the birth and death rates are low, resulting in a falling and then stable population.

STAGE 5

Declining

The fifth and final stage shows little population change, although it is somewhat ambiguous.
