Abstract. The variational formulation of boundary value problems is valuable in providing remarkably easy computational algorithms as well as an alternative framework with which to prove existence results. Boundary conditions impose constraints which can be annoying from a computational point of view. The question is then posed: what is the most general boundary value problem which can be posed in variational form with the boundary conditions appearing naturally? Special cases of two-point problems in one-dimension and some higher dimensional problems are addressed. There is a deep connection with self-adjointness for the linear case. Further cases under which a Lagrangian may or may not exist are explained.

Keywords: natural boundary conditions, self-adjointness, Hamiltonian, Lagrangian.

1. Introduction

1.1. Background

Variational methods provide a conceptual and computational framework for boundary value problems (BVP's). In the paper we derive conditions which guarantee that a given BVP can be reformulated in variational form. This can be a way of proving existence for BVP's (Graham-Eagle and Wake [6]) and it also provides a scheme for determination of a computational algorithm as in Fradkin and Wake [5]. In the case of nonlinear eigenvalue problems, these can be a way of producing outcomes like parameter path-following as has been produced by other means by computer packages like Auto (Doedel [2]).

The question of what precise conditions need to be imposed on boundary value problems so that they can be written in variational form has been discussed sporadically in the literature, see for example Anderson and Thompson [1], Fels [3],

Variational Methods, for Boundary Value Problems, for Systems of Elliptic Equations M. A. Lavrent'ev, 1963 Multiple Solutions Of Boundary Value Problems: A Variational Approach John R Graef, Lingju Kong, 2015-08-26 Variational methods and their generalizations have been verified to be useful tools in proving the existence of solutions to a variety of boundary value problems for ordinary impulsive and partial differential equations as well as for difference equations In this monograph we look at how variational methods can be used in all these settings In our first chapter we gather the basic notions and fundamental theorems that will be applied in the remainder of this monograph While many of these items are easily available in the literature we gather them here both for the convenience of the reader and for the purpose of making this volume somewhat self contained Subsequent chapters deal with the Sturm Liouville problems multi point boundary value problems problems with impulses partial differential equations and difference equations An extensive bibliography is also included

Variational Methods for Boundary Value Problems for Systems of Elliptic Equations M. A.
