**Tree Lattices** Hyman Bass, Alexander Lubotzky, 2001 UPDATED 6 6 2000 Group actions on trees furnish a unified geometric way of recasting the chapter of combinatorial group theory dealing with free groups amalgams and HNN extensions Some of the principal examples arise from rank one simple Lie groups over a non archimedean local field acting on their Bruhat Tits trees In particular this leads to a powerful method for studying lattices in such Lie groups This monograph extends this approach to the more general investigation of  $X$  lattices  $\Gamma$  where  $X$  is a locally finite tree and  $\Gamma$  is a discrete group of automorphisms of  $X$  of finite covolume These tree lattices are the main object of study Special attention is given to both parallels and contrasts with the case of Lie groups Beyond the Lie group connection the theory has applications to combinatorics and number theory The authors present a coherent survey of the results on uniform tree lattices and a previously unpublished development of the theory of non uniform tree lattices including some fundamental and recently proved existence theorems Non uniform tree lattices are much more complicated than uniform ones thus a good deal of attention is given to the construction and study of diverse examples Some interesting new phenomena are observed here which cannot occur in the case of Lie groups The fundamental technique is the encoding of tree actions in terms of the corresponding quotient graph of groups it Tree Lattices should be a helpful resource to researchers in the field and may also be used for a graduate course in geometric group theory

performance guarantees that do not rely on any assumptions In addition we show that these results generalize to counting matchings in any graph which is the Cayley graph of a finite group The second problem is counting self avoiding walks in lattices This problem arises in the study of the thermodynamics of long polymer chains in dilute solution While there are a number of Monte Carlo algorithms used to count self avoiding walks in practice these are heuristic and their correctness relies on unproven conjectures In contrast we present an efficient algorithm which relies on a single widely believed conjecture that is simpler than preceding assumptions and more importantly is one which the algorithm itself can test Thus our algorithm is reliable in the sense that it either outputs answers that are guaranteed with high probability to be correct or finds a counterexample to the conjecture In either case we know we can trust our results and the algorithm is guaranteed to run in polynomial time This is the first algorithm for counting self avoiding walks in which the error bounds are rigorously controlled The Tree Lover ,1935 **Siberian Mathematical Journal** ,2007 Soviet Electrochemistry ,1978
