**KORSO: Methods, Languages, and Tools for the Construction of Correct Software** Manfred Broy, Stefan Jähnichen, 1995-11-08 This book constitutes the final report of the work carried out in the project KORSO Korrekte Software funded by the German Federal Ministry for Research and Technology KORSO is an evolutionary prototype oriented project aimed at improving the theoretical foundations of quality driven software engineering and at implementing known techniques for applications of practical relevance The 21 strictly refereed papers presented are organized in five sections on methods for correctness languages development systems and logical frameworks tools and case studies In addition the preface and introductory paper give valuable background information and a concise state of the art overview *Algebraic Specification Techniques in Object Oriented Programming Environments* Ruth Breu, 1991-12-04 The main aim of this monograph is to provide a framework for the integrated design of object oriented programs with algebraic specification techniques The design method pursued relies fundamentally on the structuring of systems based on the notion of data types Depending on the level of abstraction data types are described in an object oriented way by algebraic specifications or by machine executable object oriented programs The treatment involves two main aspects First object oriented programs have to be related by a notion of correctness that models the transition from specifications to program implementations The author presents a notion of correctness which relies on the idea of abstraction functions Second in order to obtain an integrated design environment a uniform structuring concept for object oriented programs and algebraic specifications has to be provided Inheritance subtyping and clientship are three central notions of object oriented structuring The author uses them to develop the kernel of a typed object oriented programming language The monograph provides the formal foundation for a unified framework of algebraic specifications and object oriented programs A major guideline is the development of a design method supporting the structured design and reuse of software in this environment **Conclog: A Methodological Approach to Concurrent Logic Programming** Jean-Marie Jacquet, 1991-11-27 This book presents a new concurrent logic

programming language called Conclg and a methodology for programming in it Conclg was designed by taking the ideal features of logic programming as reference rather than by concentrating directly on operational tricks to ensure efficiency This leads to quite easy declarative programming Concern for soundness and completeness ensures that multi directional and multi solution correct procedures can be coded quite straightforwardly Assuming suitable hypotheses on their uses they can be transformed into very efficient versions thanks to the introduction of appropriate control information Correctness preserving properties are given for that purpose The design of Conclg involves three steps First a sound and complete parallel execution model of Horn clause programs is proposed which reduces subgoals of conjunctions independently and uses a calculus for reconciling inconsistent bindings Second this is extended to handle negation as completely as possible Third a minimal and reasonably complete set of extra logical features are defined for optimization and practical purposes The second part of the book presents a methodology for constructing Conclg in a rigorous way This covers the entire programming process from informal specifications via logic descriptions to efficient programs The methodology can be adapted to other languages

International Symposium (4th : 1991 : Noordwijkerhout, 1991 Programming Languages Implementation and Logic Programming, 1992 The Nested Universal Relation Database Model Mark Levene, 1992-05-20 This monograph describes a method of data modelling whose basic aim is to make databases easier to use by providing them with logical data independence To achieve this the nested UR universal relation model is defined by extending the classical UR model to nested relations Nested relations generalize flat relations and allow hierarchically structured objects to be modelled directly whereas the classical UR model allows the user to view the database as if it were composed of a single flat relation The author presents a comprehensive formalisation of the nested relational model which incorporated null values into the model Functional data dependencies and the classical notion of lossless decomposition are extended to nested relations and an extended chase procedure is defined to test the satisfaction of the data dependencies The nested UR model is defined and the classical UR model is shown to be a special case of the nested model This implies that an UR interface can be implemented by using the nested UR model thus gaining the full advantages of nested relations over flat relations Proceedings, 1996 **Formal Techniques in Real-time and Fault-tolerant Systems**, 1991 **The Use of Projective Geometry in Computer Graphics** Ivan Herman, 1992
